

12.7: Field Properties

Learning Outcomes

- Differentiate among field properties

Regardless of how you created your table, it is a good idea to examine and set field properties. While some properties are available in Datasheet view, some properties can only be set in **Design view**. To switch to Design view, right-click the table in the Navigation Pane and then click Design View. To see a field's properties, click the field in the design grid. The properties are displayed below the design grid, under **Field Properties**.

To see a description of each field property, click the property and read the description in the box next to the property list under **Field Properties**. You can get more detailed information by clicking the Help button.

Field Properties sets boundaries on what/how data is entered into table fields. There are five types of field properties:

- **Field Size:** sets the maximum number of characters that can be entered into a text field.
- **Format:** sets how the data is to be displayed in the table field.
- **Input Mask:** sets the rules as to how data can be entered so that data is entered correctly.
- **Default Value:** sets the default value that will appear in the table field each time a new record is entered.
- **Required:** sets whether a value is required to be entered into this table field.
