

Appendix II: Review of laboratory synthesis reactions

While the focus of this textbook is on organic reactions occurring in living cells, if you are a chemistry major, or are planning to take a standardized exam such as the MCAT, you will need to be familiar with a number of laboratory synthesis reactions. Here, we review the lab synthesis reactions covered in this text, which include most of the reactions typically covered in traditional organic texts. Click on the chapter/section number for direct links to the section where these reactions are introduced.

NOTE: content below redirects to an older edition of the text, which differs from the current version in some content and organization.

Section 8.5B:

an organic tosylate (R-OTs)

an organic mesylate (R-OMs)

alcohols converted into good leaving groups

Section 9.1B:

Williamson ether synthesis

alkyl halide must be methyl or primary to avoid competing elimination

Section 11.4B:

cyclic acetal 'protects' ketone/aldehyde group – stable to bases/nucleophiles

deprotect with aqueous acid

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

Section 12.2D:

activates carboxylic acids

acetic anhydride is a good acetyl group donor (activated acetic acid)

adds acetyl group to acohols, amines

Section 13.6A

goes through enamine intermediate

haloform reaction – also works with Br₂, I₂

Section 13.6B

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

Section 13.6C

Section 13.6D

Grignard reagent – carbon nucleophile

No acidic protons can be present (it's a strong base)

Can also use R-Cl

Grignards add to esters, acid chlorides **twice**

organolithium – similar to Grignard

Gilman reagent

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

Gilman reagent will react with alkyl, vinyl halides as well as carbonyls

Gilman reagent will add **once** to acid chlorides to make a ketone

Section 14.2B

nucleophilic aromatic substitution

Section 14.3A

Hoffman elimination - least substituted alkene produced

Cope elimination

Section 15.2B

Section 15.2D

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

anti-Markovnikov addition of water to alkene. Notice syn addition!

method to protect alcohol – remove with H_3O^+

another alcohol protecting group: remove with F^- ion

Section 15.6A:

watch out for the possibility of carbocation rearrangements!

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

watch out for the possibility of carbocation rearrangements!

ortho-para directing vs. meta-directing groups

Section 15.7A:

Markovnikov addition of water without possibility of carbocation shifting

Section 15.7C:

pinacol rearrangement

Hoffman rearrangement

Section 15.10:

Diels-Alder: cis/trans stereoselectivity

bicyclic Diels-Alder product - no stereoselectivity

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

Cope rearrangement

Claisen rearrangement

Section 16.11B:

Section 16.13A:

reduces aldehydes/ketones, but not carboxylic acid derivatives

reduces aldehydes, ketones, carboxylic acid derivatives

can reduce ester/amide to aldehyde (LiAlH_4 can't do this)

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

Section 16.13B:

alkynes, aldehyde, ketones, nitro groups also reduced by H_2/Pt (but not acid derivatives!)

alkyne to cis-alkene

alkyne to trans-alkene

Section 16.13C:

Section 16.13D:

primary alcohol to acid

secondary alcohol to ketone

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

oxidation at the benzylic position

Swern oxidation

abbreviated PCC

cis diols cleaved, not trans

File failed to load: <https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.3/jax/output/HTML-CSS/jax.js>

KMnO₄ also oxidizes primary alcohols and aldehydes to acids

Section 17.2B:

radical halogenation is regiospecific – depends on stability of radical intermediate

NBS can be source of Br in radical halogenation reactions

regiospecificity: benzylic / allylic

Organic Chemistry With a Biological Emphasis by Tim Soderberg (University of Minnesota, Morris)
