

## 9.17: Twinning by metric merohedry

---

Twinning by metric merohedry is a special case of twinning by merohedry which occurs when:

- the lattice of the individual has accidentally a specialized metric which corresponds to a higher holohedry
- the twin operation belongs to this higher holohedry only

If  $H$  is the individual point group,  $D(H)$  the corresponding holohedry and  $D(L)$  the point group of the lattice, twinning by metric merohedry corresponds to  $D(L) \supset D(H) \supseteq H$

Twinning by metric merohedry can be seen as the degeneration of twinning by reticular merohedry to twin index 1, or of twinning by pseudomerohedry to twin obliquity zero.
