

## CHAPTER OVERVIEW

### 3: Compounds with Carbon–Sulfur Single Bonds

A carbohydrate derivative that contains a sulfur atom bonded to two carbon atoms is capable of forming carbon-centered radicals. A common pathway for radical formation in compounds of this type is homolytic cleavage of a carbon–sulfur bond brought about by group abstraction.

#### Topic hierarchy

- I. Introduction
- II. Reaction Mechanisms
- III. Alkylthio and Arylthio Substituted Carbohydrates and Related Compounds
- IV. Dithioacetals
- V. Thiocarbonates and Dithiocarbonates
- VI. O-Thiocarbonyl Compounds
- VII. Sulfones
- VIII. Thiols and Thiyl Radicals
- IX. Summary
