

## 24.2: CLASSIFICATION OF CARBOHYDRATES

### Objectives

After completing this section, you should be able to

1. classify a specific carbohydrate as being a monosaccharide, disaccharide, trisaccharide, etc., given the structure of the carbohydrate or sufficient information about its structure.
2. classify a monosaccharide according to the number of carbon atoms present and whether it contains an aldehyde or ketone group.

### Key Terms

Make certain that you can define, and use in context, the key terms below.

- aldose
- disaccharide
- ketose
- monosaccharide (simple sugar)
- polysaccharide

Carbohydrates are the most abundant class of organic compounds found in living organisms. They originate as products of **photosynthesis**, an endothermic reductive condensation of carbon dioxide requiring light energy and the pigment chlorophyll.

As noted here, the formulas of many carbohydrates can be written as carbon hydrates,  $C_n(H_2O)_n$ , hence their name. The carbohydrates are a major source of metabolic energy, both for plants and for animals that depend on plants for food. Aside from the sugars and starches that meet this vital nutritional role, carbohydrates also serve as a structural material (cellulose), a component of the energy transport compound [ATP/ADP](#), recognition sites on cell surfaces, and one of three essential components of [DNA](#) and [RNA](#).

Carbohydrates are called **saccharides** or, if they are relatively small, sugars. Several classifications of carbohydrates have proven useful, and are outlined in the following table.

<b>Complexity</b>	<b>Simple Carbohydrates</b> monosaccharides		<b>Complex Carbohydrates</b> disaccharides, oligosaccharides & polysaccharides		
<b>Size</b>	<b>Tetrose</b> C <sub>4</sub> sugars	<b>Pentose</b> C <sub>5</sub> sugars	<b>Hexose</b> C <sub>6</sub> sugars	<b>Heptose</b> C <sub>7</sub> sugars	etc.
<b>C=O Function</b>	<b>Aldose</b> sugars having an aldehyde function or an acetal equivalent. <b>Ketose</b> sugars having a ketone function or an acetal equivalent.				
<b>Reactivity</b>	<b>Reducing</b> sugars oxidized by Tollens' reagent (or Benedict's or Fehling's reagents). <b>Non-reducing</b> sugars not oxidized by Tollens' or other reagents.				

## EXERCISES

### QUESTIONS

#### Q25.1.1

Classify each of the following sugars.

#### SOLUTIONS

##### S25.1.1

- (a) Aldotetrose
- (b) Ketopentose
- (c) Ketohexose
- (d) Aldopentose

#### CONTRIBUTORS AND ATTRIBUTIONS

- Dr. Dietmar Kennepohl FCIC (Professor of Chemistry, [Athabasca University](#))
- Prof. Steven Farmer ([Sonoma State University](#))
- William Reusch, Professor Emeritus ([Michigan State U.](#)), [Virtual Textbook of Organic Chemistry](#)
