15.7.1: Lecture Demonstrations

Calorimeter Constant

To a styrofoam cup calorimeter containing 250 mL of water at 24.0 ^oC is added a known amount of heat as 250 mL of water from a second styrofoam cup at 32.0 ^oC. The final temperature, measured by a computer-interfaced thermistor, is 27.7 ^oC. The computer-generated plot of T vs. time should be projected[1]. What is the calorimeter constant?

$\Delta T_{\text{calorimeter}} = 27.7\ ^oC – 24.0\ ^oC = 3.7\ ^oC$

$\Delta T_{\text{cold}} = 27.5\ ^oC – 24.0\ ^oC = 3.7\ ^oC$

$\Delta T_{\text{hot}} = 27.7 – 32.0 = -4.3\ ^oC$

$q_{\text{hot}} = m \text{ x S.H. x } \Delta T = 250 \text{ g x } 4.18 \text{ J/g}^oC \text{ x } -4.3^oC = -4494 \text{ J}$

$q_{\text{cold}} = m \text{ x S.H. x } \Delta T = 250 \text{ x } 4.18 \text{ x } 3.7\ ^oC = 3867 \text{ J}$

$q_{\text{calorimeer}} + q_{\text{hot}} + q_{\text{cold}} = 0$

$q_{\text{calorimeter}}\ -4494 + 3867 = 0$

$q_{\text{calorimeter}} = 627$ J.

$C = Q_{\text{calorimeter}}/T = 627 \text{ J} / 3.7\ ^oC = 169 \text{ J}/^oC$

The Ammonium Nitrate "Cold Pack"[2]

A styrofoam cup calorimeter contains 250 mL of water at 25.0^{o}C. Solid NH_4NO_3 (5 g) is added, and the temperature falls to 23.8^{o}C. The computer-generated plot of T vs. time should be projected[3]. The calorimeter is found to absorb 169 J to change its temperature 1 ^{o}C, so it is said to have a calorimeter constant of 169 J/^{o}C. What is the enthalpy change for the dissolution reaction?

$q_{\text{water}} = m \text{ x S.H. x } \Delta T = 250 \text{ g x } 4.18 \text{ J/g}^oC \text{ x } -1.2^oC$

= -1254 J

$q_{\text{calorim}} = C \text{ x } \Delta T = 169 \text{ x } -1.2^oC = -203 \text{ J}$

$q_{\text{tot}} = -1254 + -203 = -1457$ J

$q_{\text{rxn}} = +1457$ J.

$\Delta H_{\text{rxn}} = q \text{ (kJ)} / n \text{ (mol)}$

$n = m / M = 5 \text{ g } NH_4NO_3 / 80 \text{ g/mol} = 0.057 \text{ mol}$

$\Delta H_{\text{rxn}} = q/n = 1.457 \text{ kJ} / 0.057 \text{ mol} = +25.6 \text{ kJ/mol}$

The reaction is spontaneous even though it is endothermic, because of the large positive entropy change resulting from water association with the separate ions in solution.
