

## 9.7: Particle in a Slanted Well Potential

### Numerical Solutions for Schrödinger's Equation for the Particle in the Slanted Box

Parameters go here:  $x_{max} = 1$   $\mu = 1$   $V_0 = 2$

Potential energy  $V(x) = V_0x$

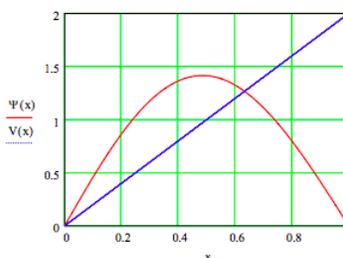

Given

$$-\frac{1}{2\mu} \frac{d^2}{dx^2} \psi(x) + V(x)\psi(x) = E\psi(x)$$

with these boundary conditions:  $\psi(0) = 0$  and  $\psi'(1) = 0$

$\psi = \text{Odesolve}(x, x_{max})$  Normalize wavefunction:  $\psi(x) = \frac{\psi(x)}{\sqrt{\int_0^{x_{max}} \psi(x)^2 dx}}$

Enter energy guess:  $E = 5.925$

Calculate most probably position:  $x = 0.5$  Given  $\frac{d}{dx}\psi(x) = 0$  Find  $(x) = 0.485$

Calculate average position:  $X_{avg} = \int_0^1 \psi(x)(x)\psi(x)dx$   $X_{avg} = 0.491$

Calculate potential and kinetic energy:

$$V_{avg} = V_0 X_{avg} \quad V_{avg} = 0.983$$

$$T_{avg} = E - V_{avg} \quad T_{avg} = 4.942$$
