

12.14: MORE NMR EXAMPLES

ADDITIONAL NMR EXAMPLES

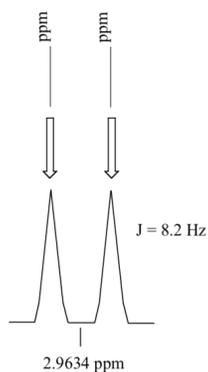

For each molecule, predict the number of signals in the ^1H -NMR and the ^{13}C -NMR spectra (do not count split peaks - eg. a quartet counts as only one signal). Assume that diastereotopic groups are non-equivalent.

P5.2: For each of the 20 common amino acids, predict the number of signals in the proton-decoupled ^{13}C -NMR spectrum.

P5.3: Calculate the chemical shift value (expressed in Hz, to one decimal place) of each sub-peak on the ^1H -NMR doublet signal below. Do this for:

- a spectrum obtained on a 300 MHz instrument
- a spectrum obtained on a 100 MHz instrument

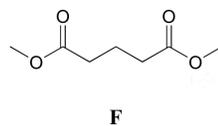

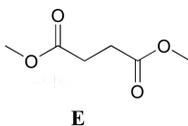

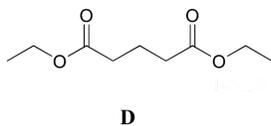

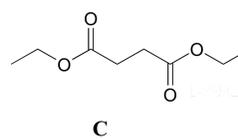

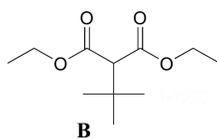

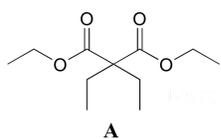

P5.4: Consider a quartet signal in an ^1H -NMR spectrum obtained on a 300 MHz instrument. The chemical shift is recorded as 1.7562 ppm, and the coupling constant is $J = 7.6$ Hz. What is the chemical shift, expressed to the nearest 0.1 Hz, of the furthest downfield sub-peak in the quartet? What is the resonance frequency (again expressed in Hz) of this sub-peak?

P5.5: One easily recognizable splitting pattern for the aromatic proton signals from disubstituted benzene structures is a pair of doublets. Does this pattern indicate *ortho*, *meta*, or *para* substitution?

P5.6: Match spectra below to their corresponding structures A-F.

P5.14: You obtain the following data for an unknown sample. Deduce its structure.

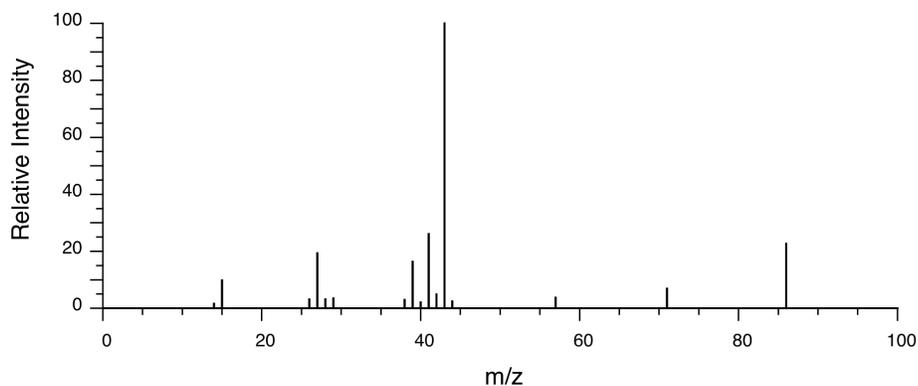

¹H-NMR:

¹³C-NMR:

Mass Spectrometry:

P5.15: You take a ^1H -NMR spectrum of a sample that comes from a bottle of 1-bromopropane. However, you suspect that the bottle might be contaminated with 2-bromopropane. The NMR spectrum shows the following peaks:

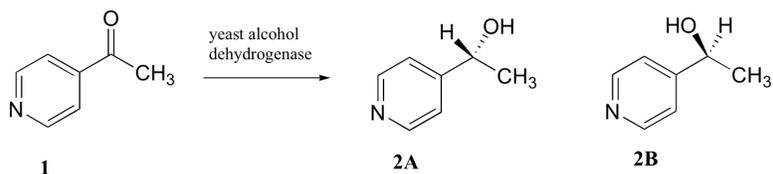

δ	splitting	integration
4.3	septet	0.0735
3.4	triplet	0.661
1.9	sextet	0.665
1.7	doublet	0.441
1.0	triplet	1.00

How badly is the bottle contaminated? Specifically, what percent of the molecules in the bottle are 2-bromopropane?

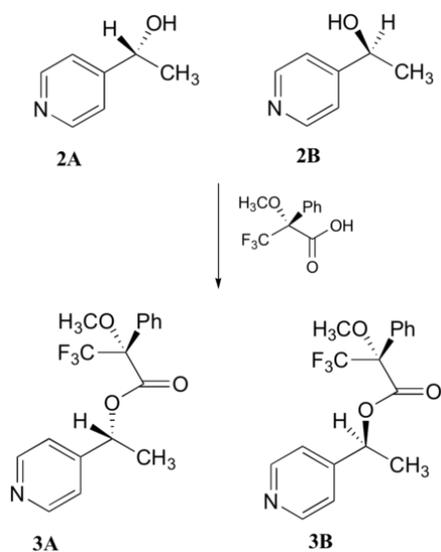

Challenge problems

C5.1: All of the ^{13}C -NMR spectra shown in this chapter include a signal due to CDCl_3 , the solvent used in each case. Explain the splitting pattern for this signal.

C5.2: Researchers wanted to investigate a reaction which can be catalyzed by the enzyme alcohol dehydrogenase in yeast. They treated 4'-acetylpyridine (**1**) with living yeast, and isolated the alcohol product(s) (some combination of **2A** and **2B**).

- Will the products **2A** and **2B** have identical or different ^1H -NMR spectra? Explain.
- Suggest a ^1H -NMR experiment that could be used to determine what percent of starting material (**1**) got turned into product (**2A** and **2B**).
- With purified **2A/2B**, the researchers carried out the subsequent reaction shown below to make **3A** and **3B**, known as 'Mosher's esters'. Do **3A** and **3B** have identical or different ^1H -NMR spectra? Explain.

d) Explain, very specifically, how the researchers could use $^1\text{H-NMR}$ to determine the relative amounts of 2A and 2B formed in the reaction catalyzed by yeast enzyme.
