

5.12: Practice

Conceptual Questions

Electrical Current

1. Can a wire carry a current and still be neutral—that is, have a total charge of zero? Explain.
2. Car batteries are rated in ampere-hours ($\text{A}\cdot\text{h}$). To what physical quantity do ampere-hours correspond (voltage, current, charge, energy, power,...)?
3. When working with high-power electric circuits, it is advised that whenever possible, you work “one-handed” or “keep one hand in your pocket.” Why is this a sensible suggestion?

Model of Conduction in Metals

4. Incandescent light bulbs are being replaced with more efficient LED and CFL light bulbs. Is there any obvious evidence that incandescent light bulbs might not be that energy efficient? Is energy converted into anything but visible light?
5. It was stated that the motion of an electron appears nearly random when an electrical field is applied to the conductor. What makes the motion nearly random and differentiates it from the random motion of molecules in a gas?
6. Electric circuits are sometimes explained using a conceptual model of water flowing through a pipe. In this conceptual model, the voltage source is represented as a pump that pumps water through pipes and the pipes connect components in the circuit. Is a conceptual model of water flowing through a pipe an adequate representation of the circuit? How are electrons and wires similar to water molecules and pipes? How are they different?
7. An incandescent light bulb is partially evacuated. Why do you suppose that is?

Resistivity and Resistance

8. The IR drop across a resistor means that there is a change in potential or voltage across the resistor. Is there any change in current as it passes through a resistor? Explain.
9. Do impurities in semiconducting materials listed in Table 9.1 supply free charges? (Hint: Examine the range of resistivity for each and determine whether the pure semiconductor has the higher or lower conductivity.)
10. Does the resistance of an object depend on the path current takes through it? Consider, for example, a rectangular bar—is its resistance the same along its length as across its width?

11. If aluminum and copper wires of the same length have the same resistance, which has the larger diameter? Why?

Ohm's Law

12. In Determining Field from Potential, resistance was defined as $R \equiv \frac{V}{I}$. In this section, we presented Ohm's law, which is commonly expressed as $\mathbf{V}=\mathbf{IR}$. The equations look exactly alike. What is the difference between Ohm's law and the definition of resistance?
13. Shown below are the results of an experiment where four devices were connected across a variable voltage source. The voltage is increased and the current is measured. Which device, if any, is an ohmic device?

Current vs. Voltage

14. The current I is measured through a sample of an ohmic material as a voltage V is applied. (a) What is the current when the voltage is doubled to $2V$ (assume the change in temperature of the material is negligible)? (b) What is the voltage applied is the current measured is $0.2I$ (assume the change in temperature of the material is negligible)? What will happen to the current if the material if the voltage remains constant, but the temperature of the material increases significantly?

Electrical Energy and Power

15. Common household appliances are rated at 110 V , but power companies deliver voltage in the kilovolt range and then step the voltage down using transformers to 110 V to be used in homes. You will learn in later chapters that transformers consist of many turns of wire, which warm up as current flows through them, wasting some of the energy that is given off as heat. This sounds inefficient. Why do the power companies transport electric power using this method?
16. Your electric bill gives your consumption in units of kilowatt-hour ($\text{kW} \cdot \text{h}$). Does this unit represent the amount of charge, current, voltage, power, or energy you buy?
17. Resistors are commonly rated at $\frac{1}{8}\text{ W}$, $\frac{1}{4}\text{ W}$, $\frac{1}{2}\text{ W}$, 1 W and 2 W for use in electrical circuits. If a current of $I=2.00\text{ A}$ is accidentally passed through a $R=1.00\Omega$ resistor rated at 1 W , what would be the most probable outcome? Is there anything that can be done to prevent such an accident?
18. An immersion heater is a small appliance used to heat a cup of water for tea by passing current through a resistor. If the voltage applied to the appliance is doubled, will the time required to heat the water change? By how much? Is this a good idea?

Superconductors

19. What requirement for superconductivity makes current superconducting devices expensive to operate?
20. Name two applications for superconductivity listed in this section and explain how superconductivity is used in the application. Can you think of a use for superconductivity that is not listed?

Problems

Electrical Current

21. A Van de Graaff generator is one of the original particle accelerators and can be used to accelerate charged particles like protons or electrons. You may have seen it used to make human hair stand on end or produce large sparks. One application of the Van de Graaff generator is to create X-rays by bombarding a hard metal target with the beam. Consider a beam of protons at 1.00 keV and a current of 5.00 mA produced by the generator.
- What is the speed of the protons?
 - How many protons are produced each second?
22. A cathode ray tube (CRT) is a device that produces a focused beam of electrons in a vacuum. The electrons strike a phosphor-coated glass screen at the end of the tube, which produces a bright spot of light. The position of the bright spot of light on the screen can be adjusted by deflecting the electrons with electrical fields, magnetic fields, or both. Although the CRT tube was once commonly found in televisions, computer displays, and oscilloscopes, newer appliances use a liquid crystal display (LCD) or plasma screen. You still may come across a CRT in your study of science. Consider a CRT with an electron beam average current of $25.00\mu\text{A}$. How many electrons strike the screen every minute?

23. How many electrons flow through a point in a wire in 3.00 s if there is a constant current of $I=4.00\text{A}$?
24. A conductor carries a current that is decreasing exponentially with time. The current is modeled as $I = I_0 e^{-t/\tau}$, where $I_0 = 3.00\text{A}$ is the current at time $t=0.00\text{s}$ and $\tau=0.50\text{s}$ is the time constant. How much charge flows through the conductor between $t=0.00\text{s}$ and $t=3\tau$?
25. The quantity of charge through a conductor is modeled as $Q = 4.00 \frac{\text{C}}{\text{s}^4} t^4 - 1.00 \frac{\text{C}}{\text{s}} t + 6.00\text{mC}$. What is the current at time $t=3.00\text{s}$?
26. The current through a conductor is modeled as $I(t) = I_m \sin(2\pi[60\text{Hz}]t)$. Write an equation for the charge as a function of time.
27. The charge on a capacitor in a circuit is modeled as $Q(t) = Q_{\max} \cos(\omega t + \phi)$. What is the current through the circuit as a function of time?

Model of Conduction in Metals

28. An aluminum wire 1.628 mm in diameter (14-gauge) carries a current of 3.00 amps.
- What is the absolute value of the charge density in the wire?
 - What is the drift velocity of the electrons?
 - What would be the drift velocity if the same gauge copper were used instead of aluminum? The density of copper is 8.96g/cm^3 and the density of aluminum is 2.70g/cm^3 . The molar mass of aluminum is 26.98 g/mol and the molar mass of copper is 63.5 g/mol. Assume each atom of metal contributes one free electron.
29. The current of an electron beam has a measured current of $I=50.00\mu\text{A}$ with a radius of 1.00 mm. What is the magnitude of the current density of the beam?
30. A high-energy proton accelerator produces a proton beam with a radius of $r=0.90\text{mm}$. The beam current is $I=9.00\mu\text{A}$ and is constant. The charge density of the beam is $n = 6.00 \times 10^{11}$ protons per cubic meter.
- What is the current density of the beam?
 - What is the drift velocity of the beam?
 - How much time does it take for 1.00×10^{10} protons to be emitted by the accelerator?
31. Consider a wire of a circular cross-section with a radius of $R=3.00\text{mm}$. The magnitude of the current density is modeled as $J = cr^2 = 5.00 \times 10^6 \frac{\text{A}}{\text{m}^4} r^2$. What is the current through the inner section of the wire from the center to $r=0.5R$?
32. A cylindrical wire has a current density from the center of the wire's cross section as $J(r) = Cr^2$ where r is in meters, J is in amps per square meter, and $C = 10^3 \text{ A/m}^4$. This current density continues to the end of the wire at a radius of 1.0 mm. Calculate the current just outside of this wire.
33. The current supplied to an air conditioner unit is 4.00 amps. The air conditioner is wired using a 10-gauge (diameter 2.588 mm) wire. The charge density is $n = 8.48 \times 10^{28} \frac{\text{electrons}}{\text{m}^3}$. Find the magnitude of
- current density and
 - the drift velocity.

Resistivity and Resistance

34. What current flows through the bulb of a 3.00-V flashlight when its hot resistance is 3.60Ω ?
35. Calculate the effective resistance of a pocket calculator that has a 1.35-V battery and through which 0.200 mA flows.
36. How many volts are supplied to operate an indicator light on a DVD player that has a resistance of 140Ω , given that 25.0 mA passes through it?
37. What is the resistance of a 20.0-m-long piece of 12-gauge copper wire having a 2.053-mm diameter?
38. The diameter of 0-gauge copper wire is 8.252 mm. Find the resistance of a 1.00-km length of such wire used for power transmission.

39. If the 0.100-mm-diameter tungsten filament in a light bulb is to have a resistance of 0.200Ω at 20.0°C , how long should it be?
40. A lead rod has a length of 30.00 cm and a resistance of $5.00\mu\Omega$. What is the radius of the rod?
41. Find the ratio of the diameter of aluminum to copper wire, if they have the same resistance per unit length (as they might in household wiring).
42. What current flows through a 2.54-cm-diameter rod of pure silicon that is 20.0 cm long, when 1.00×10^3 is applied to it? (Such a rod may be used to make nuclear-particle detectors, for example.)
43. (a) To what temperature must you raise a copper wire, originally at 20.0°C , to double its resistance, neglecting any changes in dimensions? (b) Does this happen in household wiring under ordinary circumstances?
44. A resistor made of nichrome wire is used in an application where its resistance cannot change more than 1.00% from its value at 20.0°C . Over what temperature range can it be used?
45. Of what material is a resistor made if its resistance is 40.0% greater at 100.0°C than at 20.0°C ?
46. An electronic device designed to operate at any temperature in the range from -10.0°C to 55.0°C contains pure carbon resistors. By what factor does their resistance increase over this range?
47. (a) Of what material is a wire made, if it is 25.0 m long with a diameter of 0.100 mm and has a resistance of 77.7Ω at 20.0°C ? (b) What is its resistance at 150.0°C ?
48. Assuming a constant temperature coefficient of resistivity, what is the maximum percent decrease in the resistance of a constantan wire starting at 20.0°C ?
49. A copper wire has a resistance of 0.500Ω at 20.0°C , and an iron wire has a resistance of 0.525Ω at the same temperature. At what temperature are their resistances equal?

Ohm's Law

50. A $2.2\text{-k}\Omega$ resistor is connected across a D cell battery (1.5 V). What is the current through the resistor?
51. A resistor rated at $250\text{k}\Omega$ is connected across two D cell batteries (each 1.50 V) in series, with a total voltage of 3.00 V. The manufacturer advertises that their resistors are within 5% of the rated value. What are the possible minimum current and maximum current through the resistor?
52. A resistor is connected in series with a power supply of 20.00 V. The current measure is 0.50 A. What is the resistance of the resistor?
53. A resistor is placed in a circuit with an adjustable voltage source. The voltage across and the current through the resistor and the measurements are shown below. Estimate the resistance of the resistor.

54. The following table show the measurements of a current through and the voltage across a sample of material. Plot the data, and assuming the object is an ohmic device, estimate the resistance.

Table: Measurements of current through and the voltage across a sample of material

I(A)	V(V)
0	3

2	23
4	39
6	58
8	77
10	100
12	119
14	142
16	162

Electrical Energy and Power

55. A **20.00-V** battery is used to supply current to a **10-k Ω** resistor. Assume the voltage drop across any wires used for connections is negligible.

- What is the current through the resistor?
- What is the power dissipated by the resistor?
- What is the power input from the battery, assuming all the electrical power is dissipated by the resistor?
- What happens to the energy dissipated by the resistor?

56. What is the maximum voltage that can be applied to a **20-k Ω** resistor rated at $\frac{1}{4}$ W?

57. A heater is being designed that uses a coil of 14-gauge nichrome wire to generate 300 W using a voltage of **V=110V**. How long should the engineer make the wire?

58. An alternative to CFL bulbs and incandescent bulbs are light-emitting diode (LED) bulbs. A 100-W incandescent bulb can be replaced by a 16-W LED bulb. Both produce 1600 lumens of light. Assuming the cost of electricity is \$0.10 per kilowatt-hour, how much does it cost to run the bulb for one year if it runs for four hours a day?

59. The power dissipated by a resistor with a resistance of **R=100 Ω** is **P=2.0W**. What are the current through and the voltage drop across the resistor?

60. Running late to catch a plane, a driver accidentally leaves the headlights on after parking the car in the airport parking lot. During takeoff, the driver realizes the mistake. Having just replaced the battery, the driver knows that the battery is a 12-V automobile battery, rated at 100 A·h. The driver, knowing there is nothing that can be done, estimates how long the lights will shine, assuming there are two 12-V headlights, each rated at 40 W. What did the driver conclude?

61. A physics student has a single-occupancy dorm room. The student has a small refrigerator that runs with a current of 3.00 A and a voltage of 110 V, a lamp that contains a 100-W bulb, an overhead light with a 60-W bulb, and various other small devices adding up to 3.00 W.

- Assuming the power plant that supplies 110 V electricity to the dorm is 10 km away and the two aluminum transmission cables use 0-gauge wire with a diameter of 8.252 mm, estimate the percentage of the total power supplied by the power company that is lost in the transmission.
- What would be the result is the power company delivered the electric power at 110 kV?

62. A 0.50-W, **220- Ω** resistor carries the maximum current possible without damaging the resistor. If the current were reduced to half the value, what would be the power consumed?

Superconductors

63. Consider a power plant is located 60 km away from a residential area uses 0-gauge ($A = 42.40\text{mm}^2$) wire of copper to transmit power at a current of **I=100.00A**. How much more power is dissipated in the copper wires than it would be in superconducting wires?

64. A wire is drawn through a die, stretching it to four times its original length. By what factor does its resistance increase?

65. Digital medical thermometers determine temperature by measuring the resistance of a semiconductor device called a thermistor (which has $\alpha = -0.06/^{\circ}\text{C}$) when it is at the same temperature as the patient. What is a patient's temperature if the thermistor's resistance at that temperature is 82.0% of its value at 37°C (normal body temperature)?
66. Electrical power generators are sometimes "load tested" by passing current through a large vat of water. A similar method can be used to test the heat output of a resistor. A $R = 30\Omega$ resistor is connected to a 9.0-V battery and the resistor leads are waterproofed and the resistor is placed in 1.0 kg of room temperature water ($T = 20^{\circ}\text{C}$). Current runs through the resistor for 20 minutes. Assuming all the electrical energy dissipated by the resistor is converted to heat, what is the final temperature of the water?
67. A 12-gauge gold wire has a length of 1 meter.
- What would be the length of a silver 12-gauge wire with the same resistance?
 - What are their respective resistances at the temperature of boiling water?
68. What is the change in temperature required to decrease the resistance for a carbon resistor by 10%?

Additional Problems

69. A coaxial cable consists of an inner conductor with radius $r_i = 0.25\text{cm}$ and an outer radius of $r_o = 0.5\text{cm}$ and has a length of 10 meters. Plastic, with a resistivity of $\rho = 2.00 \times 10^{13}\Omega \cdot \text{m}$, separates the two conductors. What is the resistance of the cable?
70. A 10.00-meter long wire cable that is made of copper has a resistance of 0.051 ohms.
- What is the weight if the wire was made of copper?
 - What is the weight of a 10.00-meter-long wire of the same gauge made of aluminum?
 - What is the resistance of the aluminum wire? The density of copper is $8960\text{kg}/\text{m}^3$ and the density of aluminum is $2760\text{kg}/\text{m}^3$.
71. A nichrome rod that is 3.00 mm long with a cross-sectional area of 1.00mm^2 is used for a digital thermometer.
- What is the resistance at room temperature?
 - What is the resistance at body temperature?
72. The temperature in Philadelphia, PA can vary between 68.00°F and 100.00°F in one summer day. By what percentage will an aluminum wire's resistance change during the day?
73. When 100.0 V is applied across a 5-gauge (diameter 4.621 mm) wire that is 10 m long, the magnitude of the current density is $2.0 \times 10^8\text{A}/\text{m}^2$. What is the resistivity of the wire?
74. A wire with a resistance of 5.0Ω is drawn out through a die so that its new length is twice times its original length. Find the resistance of the longer wire. You may assume that the resistivity and density of the material are unchanged.
75. What is the resistivity of a wire of 5-gauge wire ($A = 16.8 \times 10^{-6}\text{m}^2$), 5.00 m length, and $5.10\text{m}\Omega$ resistance?
76. Coils are often used in electrical and electronic circuits. Consider a coil which is formed by winding 1000 turns of insulated 20-gauge copper wire (area 0.52mm^2) in a single layer on a cylindrical non-conducting core of radius 2.0 mm. What is the resistance of the coil? Neglect the thickness of the insulation.
77. Currents of approximately 0.06 A can be potentially fatal. Currents in that range can make the heart fibrillate (beat in an uncontrolled manner). The resistance of a dry human body can be approximately $100\text{k}\Omega$.
- What voltage can cause 0.2 A through a dry human body?
 - When a human body is wet, the resistance can fall to 100Ω . What voltage can cause harm to a wet body?
78. A 20.00-ohm, 5.00-watt resistor is placed in series with a power supply.
- What is the maximum voltage that can be applied to the resistor without harming the resistor?
 - What would be the current through the resistor?

79. A battery with an emf of 24.00 V delivers a constant current of 2.00 mA to an appliance. How much work does the battery do in three minutes?
80. A 12.00-V battery has an internal resistance of a tenth of an ohm.
- What is the current if the battery terminals are momentarily shorted together?
 - What is the terminal voltage if the battery delivers 0.25 amps to a circuit?

Challenge Problems

81. A 10-gauge copper wire has a cross-sectional area $A = 5.26 \text{ mm}^2$ and carries a current of $I = 5.00 \text{ A}$. The density of copper is $\rho = 89.50 \text{ g/cm}^3$. One mole of copper atoms ($6.02 \times 10^{23} \text{ atoms}$) has a mass of approximately 63.50 g. What is the magnitude of the drift velocity of the electrons, assuming that each copper atom contributes one free electron to the current?
82. The current through a 12-gauge wire is given as $I(t) = (5.00 \text{ A}) \sin(2\pi 60 \text{ Hz} t)$. What is the current density at time 15.00 ms?
83. A particle accelerator produces a beam with a radius of 1.25 mm with a current of 2.00 mA. Each proton has a kinetic energy of 10.00 MeV.
- What is the velocity of the protons?
 - What is the number (n) of protons per unit volume?
 - How many electrons pass a cross sectional area each second?
84. In this chapter, most examples and problems involved direct current (DC). DC circuits have the current flowing in one direction, from positive to negative. When the current was changing, it was changed linearly from $I = -I_{max}$ to $I = +I_{max}$ and the voltage changed linearly from $V = -V_{max}$ to $V = +V_{max}$, where $V_{max} = I_{max} R$. Suppose a voltage source is placed in series with a resistor of $R = 10 \Omega$ that supplied a current that alternated as a sine wave, for example, $I(t) = (3.00 \text{ A}) \sin(\frac{2\pi}{4.00 \text{ s}} t)$. (a) What would a graph of the voltage drop across the resistor $V(t)$ versus time look like? (b) What would a plot of $V(t)$ versus $I(t)$ for one period look like? (Hint: If you are not sure, try plotting $V(t)$ versus $I(t)$ using a spreadsheet.)
85. A current of $I = 25 \text{ A}$ is drawn from a 100-V battery for 30 seconds. By how much is the chemical energy reduced?
86. Consider a square rod of material with sides of length $L = 3.00 \text{ cm}$ with a current density of $J = J_0 e^{\alpha x} \hat{k} = (0.35 \frac{\text{A}}{\text{m}^2}) e^{(2.1 \times 10^{-3} \text{ m}^{-1}) x} \hat{k}$ as shown below. Find the current that passes through the face of

87. A resistor of an unknown resistance is placed in an insulated container filled with 0.75 kg of water. A voltage source is connected in series with the resistor and a current of 1.2 amps flows through the resistor for 10 minutes. During this time, the temperature of the water is measured and the temperature change during this time is $\Delta T = 10.00^\circ \text{C}$.
- What is the resistance of the resistor?

(b) What is the voltage supplied by the power supply?

88. The charge that flows through a point in a wire as a function of time is modeled as $q(t) = q_0 e^{-t/T} = 10.0 C e^{-t/5s}$.

(a) What is the initial current through the wire at time $t=0.00s$?

(b) Find the current at time $t = \frac{1}{2}T$.

(c) At what time t will the current be reduced by one-half $I = \frac{1}{2}I_0$?

89. Consider a resistor made from a hollow cylinder of carbon as shown below. The inner radius of the cylinder is $R_i=0.20mm$ and the outer radius is $R_o = 0.30mm$. The length of the resistor is $L=0.90mm$. The resistivity of the carbon is $\rho = 3.5 \times 10^{-5} \Omega \cdot m$. (a) Prove that the resistance perpendicular from the axis is $R = \frac{\rho}{2\pi L} \ln(\frac{R_o}{R_i})$. (b) What is the resistance?

90. What is the current through a cylindrical wire of radius $R=0.1mm$ if the current density is $J = \frac{J_0}{R} r$, where $J_0 = 32000 \frac{A}{m^2}$?

91. A student uses a 100.00-W, 115.00-V radiant heater to heat the student's dorm room, during the hours between sunset and sunrise, 6:00 p.m. to 7:00 a.m.

(a) What current does the heater operate at?

(b) How many electrons move through the heater?

(c) What is the resistance of the heater?

(d) How much heat was added to the dorm room?

92. A 12-V car battery is used to power a 20.00-W, 12.00-V lamp during the physics club camping trip/star party. The cable to the lamp is 2.00 meters long, 14-gauge copper wire with a charge density of $n = 9.50 \times 10^{28} m^{-3}$.

(a) What is the current draw by the lamp?

(b) How long would it take an electron to get from the battery to the lamp?

93. A physics student uses a 115.00-V immersion heater to heat 400.00 grams (almost two cups) of water for herbal tea. During the two minutes it takes the water to heat, the physics student becomes bored and decides to figure out the resistance of the heater. The student starts with the assumption that the water is initially at the temperature of the room $T_i = 25.00^\circ C$ and reaches $T_f = 100.00^\circ C$. The specific heat of the water is $c = 4180 \frac{J}{kg}$. What is the resistance of the heater?

Practice Answers

Check Your Understanding

1. The time for 1.00 C of charge to flow would be $\Delta t = \frac{\Delta Q}{I} = \frac{1.00C}{0.300 \times 10^{-3} C/s} = 3.33 \times 10^3 s$, slightly less than an hour. This is quite different from the 5.55 ms for the truck battery. The calculator takes a very small amount of energy to

operate, unlike the truck's starter motor. There are several reasons that vehicles use batteries and not solar cells. Aside from the obvious fact that a light source to run the solar cells for a car or truck is not always available, the large amount of current needed to start the engine cannot easily be supplied by present-day solar cells. Solar cells can possibly be used to charge the batteries. Charging the battery requires a small amount of energy when compared to the energy required to run the engine and the other accessories such as the heater and air conditioner. Present day solar-powered cars are powered by solar panels, which may power an electric motor, instead of an internal combustion engine.

2. The total current needed by all the appliances in the living room (a few lamps, a television, and your laptop) draw less current and require less power than the refrigerator.

3. The diameter of the 14-gauge wire is smaller than the diameter of the 12-gauge wire. Since the drift velocity is inversely proportional to the cross-sectional area, the drift velocity in the 14-gauge wire is larger than the drift velocity in the 12-gauge wire carrying the same current. The number of electrons per cubic meter will remain constant.

4. The current density in a conducting wire increases due to an increase in current. The drift velocity is inversely proportional to the current ($v_d = \frac{I}{nqA}$), so the drift velocity would decrease.

5. Silver, gold, and aluminum are all used for making wires. All four materials have a high conductivity, silver having the highest. All four can easily be drawn into wires and have a high tensile strength, though not as high as copper. The obvious disadvantage of gold and silver is the cost, but silver and gold wires are used for special applications, such as speaker wires. Gold does not oxidize, making better connections between components. Aluminum wires do have their drawbacks. Aluminum has a higher resistivity than copper, so a larger diameter is needed to match the resistance per length of copper wires, but aluminum is cheaper than copper, so this is not a major drawback. Aluminum wires do not have as high of a ductility and tensile strength as copper, but the ductility and tensile strength is within acceptable levels. There are a few concerns that must be addressed in using aluminum and care must be used when making connections. Aluminum has a higher rate of thermal expansion than copper, which can lead to loose connections and a possible fire hazard. The oxidation of aluminum does not conduct and can cause problems. Special techniques must be used when using aluminum wires and components, such as electrical outlets, must be designed to accept aluminum wires.

6. The foil pattern stretches as the backing stretches, and the foil tracks become longer and thinner. Since the resistance is calculated as $R = \rho \frac{L}{A}$, the resistance increases as the foil tracks are stretched. When the temperature changes, so does the resistivity of the foil tracks, changing the resistance. One way to combat this is to use two strain gauges, one used as a reference and the other used to measure the strain. The two strain gauges are kept at a constant temperature

7. The longer the length, the smaller the resistance. The greater the resistivity, the higher the resistance. The larger the difference between the outer radius and the inner radius, that is, the greater the ratio between the two, the greater the resistance. If you are attempting to maximize the resistance, the choice of the values for these variables will depend on the application. For example, if the cable must be flexible, the choice of materials may be limited.

8. Yes, Ohm's law is still valid. At every point in time the current is equal to $I(t) = V(t)/R$, so the current is also a function of time, $I(t) = \frac{V_{max}}{R} \sin(2\pi ft)$.

9. Even though electric motors are highly efficient 10–20% of the power consumed is wasted, not being used for doing useful work. Most of the 10–20% of the power lost is transferred into heat dissipated by the copper wires used to make the coils of the motor. This heat adds to the heat of the environment and adds to the demand on power plants providing the power. The demand on the power plant can lead to increased greenhouse gases, particularly if the power plant uses coal or gas as fuel.

10. No, the efficiency is a very important consideration of the light bulbs, but there are many other considerations. As mentioned above, the cost of the bulbs and the life span of the bulbs are important considerations. For example, CFL bulbs contain mercury, a neurotoxin, and must be disposed of as hazardous waste. When replacing incandescent bulbs that are being controlled by a dimmer switch with LED, the dimmer switch may need to be replaced. The dimmer switches for LED lights are comparably priced to the incandescent light switches, but this is an initial cost which should be considered. The spectrum of light should also be considered, but there is a broad range of color temperatures available, so you should be able to find one that fits your needs. None of these considerations mentioned are meant to discourage the use of LED or CFL light bulbs, but they are considerations.

Conceptual Questions

1. If a wire is carrying a current, charges enter the wire from the voltage source's positive terminal and leave at the negative terminal, so the total charge remains zero while the current flows through it.
3. Using one hand will reduce the possibility of "completing the circuit" and having current run through your body, especially current running through your heart.
5. Even though the electrons collide with atoms and other electrons in the wire, they travel from the negative terminal to the positive terminal, so they drift in one direction. Gas molecules travel in completely random directions.
7. In the early years of light bulbs, the bulbs are partially evacuated to reduce the amount of heat conducted through the air to the glass envelope. Dissipating the heat would cool the filament, increasing the amount of energy needed to produce light from the filament. It also protects the glass from the heat produced from the hot filament. If the glass heats, it expands, and as it cools, it contracts. This expansion and contraction could cause the glass to become brittle and crack, reducing the life of the bulbs. Many bulbs are now partially filled with an inert gas. It is also useful to remove the oxygen to reduce the possibility of the filament actually burning. When the original filaments were replaced with more efficient tungsten filaments, atoms from the tungsten would evaporate off the filament at such high temperatures. The atoms collide with the atoms of the inert gas and land back on the filament.
9. In carbon, resistivity increases with the amount of impurities, meaning fewer free charges. In silicon and germanium, impurities decrease resistivity, meaning more free electrons.
11. Copper has a lower resistivity than aluminum, so if length is the same, copper must have the smaller diameter.
13. Device B shows a linear relationship and the device is ohmic.
15. Although the conductors have a low resistance, the lines from the power company can be kilometers long. Using a high voltage reduces the current that is required to supply the power demand and that reduces line losses.
17. The resistor would overheat, possibly to the point of causing the resistor to burn. Fuses are commonly added to circuits to prevent such accidents.
19. Very low temperatures necessitate refrigeration. Some materials require liquid nitrogen to cool them below their critical temperatures. Other materials may need liquid helium, which is even more costly.

Problems

21. a. $v = 4.38 \times 10^5 \frac{m}{s}$;
b. $\Delta q = 5.00 \times 10^{-3} C$, no. of protons $= 3.13 \times 10^{16}$
23. $I = \frac{\Delta Q}{\Delta t}$, $\Delta Q = 12.00 C$, no. of electrons $= 7.46 \times 10^{19}$
25. $I(t) = 0.016 \frac{C}{s^4} t^3 - 0.001 \frac{C}{s} I(3.00 s) = 0.431 A$
27. $I(t) = -I_{max} \sin(\omega t + \phi)$
29. $|J| = 15.92 A/m^2$
31. $I = 3.98 \times 10^{-5} A$
33. a. $|J| = 7.60 \times 10^5 \frac{A}{m^2}$;
b. $v_d = 5.60 \times 10^{-5} \frac{m}{s}$
35. $R = 6.750 k\Omega$
37. $R = 0.10 \Omega$
39. $R = \rho \frac{L}{A}$; $L = 3 cm$

$$41. \frac{R_{Al}/L_{Al}}{R_{Cu}/L_{Cu}} = \frac{\rho_{Al} \frac{1}{\pi(\frac{D_{Al}}{2})^2}}{\rho_{Cu} \frac{1}{\pi(\frac{D_{Cu}}{2})^2}} = \frac{\rho_{Al}}{\rho_{Cu}} \left(\frac{D_{Cu}}{D_{Al}}\right)^2 = 1, \frac{D_{Al}}{D_{Cu}} = \sqrt{\frac{\rho_{Al}}{\rho_{Cu}}}$$

$$43. a. R = R_0(1 + \alpha \Delta T), 2 = 1 + \alpha \Delta T, \Delta T = 256.4^\circ C, T = 276.4^\circ C;$$

b. Under normal conditions, no it should not occur.

$$45. R = R_0(1 + \alpha \Delta T) \quad \alpha = 0.006^\circ C^{-1}, \text{ iron}$$

$$47. a. R = \rho \frac{L}{A}, \rho = 2.44 \times 10^{-8} \Omega \cdot m, \text{ gold}; R = \rho \frac{L}{A} (1 + \alpha \Delta T)$$

$$b. R = 2.44 \times 10^{-8} \Omega \cdot m \left(\frac{25m}{\pi(\frac{0.100 \times 10^{-3} m}{2})^2} \right) (1 + 0.0034^\circ C^{-1} (150^\circ C - 20^\circ C)) R = 112 \Omega$$

$$49. R_{Fe} = 0.525 \Omega, R_{Cu} = 0.500 \Omega, \alpha_{Fe} = 0.0065^\circ C^{-1}, \alpha_{Cu} = 0.0039^\circ C^{-1}, R_{Fe} = R_{Cu}, R_{0Fe}(1 + \alpha_{Fe}(T - T_0)) = R_{0Cu}(1 + \alpha_{Cu}(T - T_0)), \frac{R_{0Fe}}{R_{0Cu}}(1 + \alpha_{Fe}(T - T_0)) = 1 + \alpha_{Cu}(T - T_0), T = 2.91^\circ C$$

$$51. R_{min} = 2.375 \times 10^5 \Omega, I_{min} = 12.63 \mu A$$

$$R_{max} = 2.625 \times 10^5 \Omega, I_{max} = 11.43 \mu A$$

$$53. R = 100 \Omega$$

$$55. a. I = 2mA;$$

$$b. P = 0.04mW;$$

$$c. P = 0.04mW;$$

d. It is converted into heat.

$$57. P = \frac{V^2}{R}, R = 40 \Omega, A = 2.08mm^2, \rho = 100 \times 10^{-8} \Omega \cdot m, R = \rho \frac{L}{A}, L = 83m$$

$$59. I = 0.14A, V = 14V$$

$$61. a. I \approx 3.00A + \frac{100W}{110V} + \frac{60W}{110V} + \frac{3.00W}{110V} = 4.48A$$

$$P = 493W$$

$$R = 9.91 \Omega,$$

$$P_{loss} = 200.W$$

$$b. P = 493W$$

$$I = 0.0045A$$

$$R = 9.91 \Omega$$

$$P_{loss} = 201 \mu W$$

$$63. R_{copper} = 23.77 \Omega P = 2.377 \times 10^5 W$$

$$65. R = R_0(1 + \alpha(T - T_0))$$

$$0.82R_0 = R_0(1 + \alpha(T - T_0)), 0.82 = 1 - 0.06(T - 37^\circ C), T = 40^\circ C$$

$$67. a. R_{Au} = R_{Ag}, \rho_{Au} \frac{L_{Au}}{A_{Au}} = \rho_{Ag} \frac{L_{Ag}}{A_{Ag}}, L_{Ag} = 1.53m;$$

$$b. R_{Au, 20^\circ C} = 0.0074 \Omega, R_{Au, 100^\circ C} = 0.0094 \Omega, R_{Ag, 100^\circ C} = 0.0096 \Omega$$

Additional Problems

$$69. dR = \frac{\rho}{2\pi r L} dr$$

$$R = \frac{\rho}{2\pi L} \ln \frac{r_o}{r_i}$$

$$R = 2.21 \times 10^{11} \Omega$$

$$71. a. R_0 = 0.003 \Omega;$$

$$b. T_c = 37.0^\circ C \quad R = 0.00302 \Omega$$

$$73. \rho = 5.00 \times 10^{-8} \Omega \cdot m$$

$$75. \rho = 1.71 \times 10^{-8} \Omega \cdot m$$

$$77. a. V = 6000 V;$$

$$b. V = 60 V$$

$$79. P = \frac{W}{t}, W = 8.64 J$$

Challenge Problems

$$81. V = 7.09 cm^3 \quad n = 8.49 \times 10^{28} \frac{\text{electrons}}{m^3} \quad v_d = 7.00 \times 10^{-5} \frac{m}{s}$$

$$83. a. v = 4.38 \times 10^7 m/s;$$

$$b. v = 5.81 \times 10^{13} \frac{\text{protons}}{m^3};$$

$$c. 1.25 \frac{\text{electrons}}{m^3}$$

$$85. E = 75 kJ$$

$$87. a. P = 52 W \quad R = 36 \Omega;$$

$$b. V = 43.54 V$$

$$89. a. R = \frac{\rho}{2\pi L} \ln \left(\frac{R_0}{R_i} \right);$$

$$b. R = 2.5 m\Omega$$

$$91. a. I = 0.870 A;$$

$$b. \# \text{electrons} = 2.54 \times 10^{23}$$

$$c. R = 132 \Omega;$$

$$d. q = 4.68 \times 10^6 J$$

$$93. P = 1045 W, P = \frac{V^2}{R}, R = 12.27 \Omega$$
