

## 10.1: Chi-Square Distribution

A  $\chi^2$  -distribution (chi-square, pronounced “ki-square”) is another special type of distribution for a continuous random variable. The sampling distribution for a variance and standard deviation follows a chi-square distribution.

Properties of the  $\chi^2$  -distribution density curve:

1. Right skewed starting at zero.
2. The center and spread of a  $\chi^2$  -distribution are determined by the degrees of freedom with a mean =  $df$  and standard deviation =  $\sqrt{2df}$ .
3. Chi-square variables cannot be negative.
4. As the degrees of freedom increase, the  $\chi^2$  -distribution becomes normally distributed for  $df > 50$ . Figure 10-1 shows  $\chi^2$  -distributions for  $df$  of 2, 4, 10, and 30.
5. The total area under the curve is equal to 1, or 100%.

Figure 10-1

We will use the  $\chi^2$  -distribution for hypothesis testing later in this chapter. For now, we are just learning how to find a critical value  $\chi^2_\alpha$ .

The symbol  $\chi^2_\alpha$  is the critical value on the  $\chi^2$  -distribution curve with area  $1 - \alpha$  below the critical value and area  $\alpha$  above the critical value, as shown below in Figure 10-2.

Figure 10-2

Use technology to compute the critical value for the  $\chi^2$  -distribution.

**TI-84:** Use the INVCHI2 program downloaded at Rachel Webb’s website: <http://MostlyHarmlessStatistics.com>. Start the program and enter the area  $\alpha$  and the  $df$  when prompted.

**TI-89:** Go to the [Apps] **Stat/List Editor**, then select F5 [DISTR]. This will get you a menu of probability distributions. Arrow down to **Inverse > Inverse Chi-Square** and press [ENTER]. Enter the area  $1 - \alpha$  to the left of the  $\chi$  value and the  $df$  into each cell. Press [ENTER].

**Excel:** =CHISQ.INV( $1 - \alpha$ ,  $df$ ) or =CHISQ.INV.RT( $\alpha$ ,  $df$ )

Alternatively, use the following online calculator: <https://homepage.divms.uiowa.edu/~mbognar/applets/chisq.html>.

Compute the critical value  $\chi^2_\alpha$  for a  $\alpha = 0.05$  and  $df = 6$ .

### Solution

Start by drawing the curve and determining the area in the right-tail as shown in Figure 10-3. Then use technology to find the critical value.

Figure 10-3

In Excel there are two options. Use  $=\text{CHISQ.INV}(\text{area in left-tail}, df)$  or right-tail  $=\text{CHISQ.INV.RT}(\text{area in righttail}, df)$ . For this example, then we would have  $\chi^2_\alpha = \text{CHISQ.INV}(0.95, 6)$  or  $=\text{CHISQ.INV.RT}(0.05, 6) = 12.5916$ .

TI-89 use Distr > Inverse Chi-square with area 0.95 and  $df = 6$
