

7.3: Probability Computations for General Normal Random Variables

Learning Objectives

- To learn how to compute probabilities related to any normal random variable.

If X is any normally distributed normal random variable then Figure 7.3.1 can also be used to compute a probability of the form $P(a < X < b)$ by means of the following equality.

equality

If X is a normally distributed random variable with mean μ and standard deviation σ , then

$$P(a < X < b) = P\left(\frac{a - \mu}{\sigma} < Z < \frac{b - \mu}{\sigma}\right)$$

where Z denotes a standard normal random variable. a can be any decimal number or $-\infty$; b can be any decimal number or ∞ .

Cumulative Probability $P(Z \leq z)$

Figure 7.3.1: Cumulative Normal Probability

The new endpoints $\frac{(a-\mu)}{\sigma}$ and $\frac{(b-\mu)}{\sigma}$ are the z -scores of a and b as defined in Chapter 2.

Figure 7.3.2 illustrates the meaning of the equality geometrically: the two shaded regions, one under the density curve for X and the other under the density curve for Z , have the same area. Instead of drawing both bell curves, though, we will always draw a single generic bell-shaped curve with both an x -axis and a z -axis below it.

Figure 7.3.2: Probability for an Interval of Finite Length

✓ Example 7.3.1

Let X be a normal random variable with mean $\mu = 10$ and standard deviation $\sigma = 2.5$. Compute the following probabilities.

1. $P(X < 14)$.
2. $P(8 < X < 14)$.

Solution

1. See Figure 7.3.3 "Probability Computation for a General Normal Random Variable".

$$\begin{aligned}
 P(X < 14) &= P\left(Z < \frac{14 - \mu}{\sigma}\right) \\
 &= P\left(Z < \frac{14 - 10}{2.5}\right) \\
 &= P(Z < 1.60) \\
 &= 0.9452
 \end{aligned}$$

Figure 7.3.3: Probability Computation for a General Normal Random Variable

2. See Figure 7.3.4 "Probability Computation for a General Normal Random Variable".

$$\begin{aligned}
 P(8 < X < 14) &= P\left(\frac{8-10}{2.5} < Z < \frac{14-10}{2.5}\right) \\
 &= P(-0.80 < Z < 1.60) \\
 &= 0.9452 - 0.2119 \\
 &= 0.7333
 \end{aligned}$$

Figure 7.3.4: Probability Computation for a General Normal Random Variable

✓ Example 7.3.2

The lifetimes of the tread of a certain automobile tire are normally distributed with mean 37,500 miles and standard deviation 4,500 miles. Find the probability that the tread life of a randomly selected tire will be between 30,000 and 40,000 miles.

Solution

Let X denote the tread life of a randomly selected tire. To make the numbers easier to work with we will choose thousands of miles as the units. Thus $\mu = 37.5$, $\sigma = 4.5$, and the problem is to compute $P(30 < X < 40)$. Figure 7.3.5 "Probability Computation for Tire Tread Wear" illustrates the following computation:

$$\begin{aligned}
 P(30 < X < 40) &= P\left(\frac{30 - \mu}{\sigma} < Z < \frac{40 - \mu}{\sigma}\right) \\
 &= P\left(\frac{30 - 37.5}{4.5} < Z < \frac{40 - 37.5}{4.5}\right) \\
 &= P(-1.67 < Z < 0.56) \\
 &= 0.7123 - 0.0475 \\
 &= 0.6648
 \end{aligned}$$

Figure 7.3.5: Probability Computation for Tire Tread Wear

Note that the two z -scores were rounded to two decimal places in order to use Figure 7.3.1 "Cumulative Normal Probability".

✓ Example 7.3.3

Scores on a standardized college entrance examination (*CEE*) are normally distributed with mean 510 and standard deviation 60. A selective university considers for admission only applicants with *CEE* scores over 650. Find percentage of all individuals who took the *CEE* who meet the university's *CEE* requirement for consideration for admission.

Solution

Let X denote the score made on the *CEE* by a randomly selected individual. Then X is normally distributed with mean 510 and standard deviation 60. The probability that X lie in a particular interval is the same as the proportion of all exam scores that lie in that interval. Thus the solution to the problem is $P(X > 650)$, expressed as a percentage. Figure 7.3.6 "Probability Computation for Exam Scores" illustrates the following computation:

$$\begin{aligned}
 P(X > 650) &= P\left(Z > \frac{650 - \mu}{\sigma}\right) \\
 &= P\left(Z > \frac{650 - 510}{60}\right) \\
 &= P(Z > 2.33) \\
 &= 1 - 0.9901 \\
 &= 0.0099
 \end{aligned}$$

Figure 7.3.6: Probability Computation for Exam Scores

The proportion of all CEE scores that exceed 650 is 0.0099, hence 0.99% or about 1% do.

- Probabilities for a general normal random variable are computed using Figure 7.3.1 after converting x -values to z -scores.
