

## 9.3: Probability Computations for General Normal Distributions

### Learning Objectives

- Compute probabilities for any normal distribution using the  $Z$  table

In most practical problems involving normal distributions, the curve will not be as we have seen so far, with  $\mu = 0$  and  $\sigma = 1$ . When using a  $Z$  table, you will first have to standardize the distribution by calculating the  $z$ -score(s).

### Standardizing

**Standardizing** a data value,  $x$ , is the process of converting it to a  $z$ -score using the formula  $z = \frac{x - \mu}{\sigma}$ .

To compute a probability of the form  $P(a < X < b)$  we use the following process.

### Probability for General Normal Distributions

If  $X$  is normally distributed with mean  $\mu$  and standard deviation  $\sigma$ , then

$$P(a < X < b) = P\left(\frac{a - \mu}{\sigma} < Z < \frac{b - \mu}{\sigma}\right)$$

where  $Z$  denotes a standard normal distribution.  $a$  can be any decimal number or  $-\infty$ ;  $b$  can be any decimal number or  $\infty$ .

Cumulative Probability  $P(Z \leq z)$

3.9	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000

The table can also be found online [here](#) in section 6.

The new endpoints  $\frac{(a - \mu)}{\sigma}$  and  $\frac{(b - \mu)}{\sigma}$  are the  $z$ -scores of  $a$  and  $b$ .

The figure below illustrates the meaning of the process geometrically: the two shaded regions, one under the curve for  $X$  and the other under the curve for  $Z$ , have the same area. Instead of drawing both bell curves, though, we will draw a single generic bell-shaped curve with both an  $x$ -axis and a  $z$ -axis below it.

### ✓ ✓ Example 9.3.1

Let  $X$  be normally distributed with mean  $\mu = 10$  and standard deviation  $\sigma = 2.5$ . Compute the following probabilities.

- $P(X < 14)$ .
- $P(8 < X < 14)$ .

**Solution:**

- See the figure below.

$$\begin{aligned}
 P(X < 14) &= P\left(Z < \frac{14 - \mu}{\sigma}\right) \\
 &= P\left(Z < \frac{14 - 10}{2.5}\right) \\
 &= P(Z < 1.60) \\
 &= 0.9452
 \end{aligned}$$

b. See the figure below.

$$\begin{aligned}
 P(8 < X < 14) &= P\left(\frac{8-10}{2.5} < Z < \frac{14-10}{2.5}\right) \\
 &= P(-0.80 < Z < 1.60) \\
 &= 0.9452 - 0.2119 \\
 &= 0.7333
 \end{aligned}$$

### Try It 9.3.1

Let  $X$  be normally distributed with mean 37.5 and standard deviation 4.5. Find the probability that  $X$  will be between 30 and 40.

#### Answer

For  $X$ ,  $\mu = 37.5$  and  $\sigma = 4.5$ . The problem is to compute  $P(30 < X < 40)$ . The figure below illustrates the following computation:

$$\begin{aligned}
 P(30 < X < 40) &= P\left(\frac{30-\mu}{\sigma} < Z < \frac{40-\mu}{\sigma}\right) \\
 &= P\left(\frac{30-37.5}{4.5} < Z < \frac{40-37.5}{4.5}\right) \\
 &= P(-1.67 < Z < 0.56) \\
 &= 0.7123 - 0.0475 \\
 &= 0.6648
 \end{aligned}$$

Note that the two  $z$ -scores were rounded to two decimal places in order to use the table.

### ✓ ✓ Example 9.3.2

Let  $X$  be normally distributed with mean 510 and standard deviation 60. Find the percentage of data values that exceed 650.

**Solution:**

$X$  is normally distributed with mean  $\mu = 510$  and standard deviation  $\sigma = 60$ . The probability that  $X$  lies in a particular interval is the same as the proportion or percent of all data values that lie in that interval. Thus the solution to the problem is  $P(X > 650)$ , expressed as a percentage. The figure below illustrates the following computation:

$$\begin{aligned} P(X > 650) &= P\left(Z > \frac{650 - \mu}{\sigma}\right) \\ &= P\left(Z > \frac{650 - 510}{60}\right) \\ &= P(Z > 2.33) \\ &= 1 - 0.9901 \\ &= 0.0099 \end{aligned}$$

The percent of all data values that exceed 650 is 0.0099, hence 0.99% or about 1%.
