

## 11.5.1: Independent Events (Exercises)

### SECTION 11.5 PROBLEM SET: INDEPENDENT EVENTS

The distribution of the number of fiction and non-fiction books checked out at a city's main library and at a smaller branch on a given day is as follows.

|                 | MAIN (M) | BRANCH (B) | TOTAL |
|-----------------|----------|------------|-------|
| FICTION (F)     | 300      | 100        | 400   |
| NON-FICTION (N) | 150      | 50         | 200   |
| TOTALS          | 450      | 150        | 600   |

Use this table to determine the following probabilities:

|             |   |
|-------------|---|
| 1. $P(F)$   | 2. $P(M F)$   |
| 3. $P(N B)$ | 4. Is the fact that a person checks out a fiction book independent of the main library? Use probabilities to justify your conclusion. |

For a two-child family, let the events  $E$ ,  $F$ , and  $G$  be as follows.

$E$ : The family has at least one boy

$F$ : The family has children of both sexes

$G$ : The family's first born is a boy

|   |   |
|---|---|
| 5. Find the following.<br>a. $P(E)$<br>b. $P(F)$<br>c. $P(E \cap F)$<br>d. Are $E$ and $F$ independent? Use probabilities to justify your conclusion. | 6. Find the following.<br>a. $P(F)$<br>b. $P(G)$<br>c. $P(F \cap G)$<br>d. Are $F$ and $G$ independent? Use probabilities to justify your conclusion. |
|---|---|

Do the following problems involving independence.

|  |  |
|--|--|
| 7. If $P(E) = .6$ , $P(F) = .2$ , and $E$ and $F$ are independent, find $P(E \text{ and } F)$ .  | 8. If $P(E) = .6$ , $P(F) = .2$ , and $E$ and $F$ are independent, find $P(E \text{ or } F)$ .   |
| 9. If $P(E) = .9$ , $P(F E) = .36$ , and $E$ and $F$ are independent, find $P(F)$ .  | 10. If $P(E) = .6$ , $P(E \text{ or } F) = .8$ , and $E$ and $F$ are independent, find $P(F)$ .  |
| 11. In a survey of 100 people, 40 were casual drinkers, and 60 did not drink. Of the ones who drank, 6 had minor headaches. Of the non-drinkers, 9 had minor headaches. Are the events "drinkers" and "had headaches" independent?   | 12. It is known that 80% of the people wear seat belts, and 5% of the people quit smoking last year. If 4% of the people who wear seat belts quit smoking, are the events, wearing a seat belt and quitting smoking, independent?  |
| 13. John's probability of passing statistics is 40%, and Linda's probability of passing the same course is 70%. If the two events are independent, find the following probabilities.<br>a. $P(\text{both of them will pass statistics})$<br>b. $P(\text{at least one of them will pass statistics})$ | 14. Jane is flying home for the Christmas holidays. She has to change planes twice. There is an 80% chance that she will make the first connection, and a 90% chance that she will make the second connection. If the two events are independent, find the probabilities:<br>a. $P(\text{Jane will make both connections})$<br>b. $P(\text{Jane will make at least one connection})$ |

For a three-child family, let the events  $E$ ,  $F$ , and  $G$  be as follows.

$E$ : The family has at least one boy

$F$ : The family has children of both sexes

$G$ : The family's first born is a boy

|   |   |
|---|---|
| <p>15. Find the following.</p> <ol style="list-style-type: none"> <li><math>P(E)</math></li> <li><math>P(F)</math></li> <li><math>P(E \cap F)</math></li> <li>Are <math>E</math> and <math>F</math> independent?</li> </ol> | <p>16. Find the following.</p> <ol style="list-style-type: none"> <li><math>P(F)</math></li> <li><math>P(G)</math></li> <li><math>P(F \cap G)</math></li> <li>Are <math>F</math> and <math>G</math> independent?</li> </ol> |
|---|---|

### SECTION 11.5 PROBLEM SET: INDEPENDENT EVENTS

|   |   |
|---|---|
| <p>17. <math>P(K D) = 0.7</math>, <math>P(D) = 0.25</math> and <math>P(K) = 0.7</math></p> <ol style="list-style-type: none"> <li>Are events <math>K</math> and <math>D</math> independent? Use probabilities to justify your conclusion.</li> <li>Find <math>P(K \cap D)</math></li> </ol>   | <p>18. <math>P(R S) = 0.4</math>, <math>P(S) = 0.2</math> and <math>P(R) = 0.3</math></p> <ol style="list-style-type: none"> <li>Are events <math>R</math> and <math>S</math> independent?
