

9.3.1: Outcomes and the Type I and Type II Errors (Exercises)

? Exercise 9.3.1.5

The mean price of mid-sized cars in a region is \$32,000. A test is conducted to see if the claim is true. State the Type I and Type II errors in complete sentences.

Answer

Type I: The mean price of mid-sized cars is \$32,000, but we conclude that it is not \$32,000.

Type II: The mean price of mid-sized cars is not \$32,000, but we conclude that it is \$32,000.

? Exercise 9.3.1.6

A sleeping bag is tested to withstand temperatures of -15°F . You think the bag cannot stand temperatures that low. State the Type I and Type II errors in complete sentences.

? Exercise 9.3.1.7

For Exercise 9.12, what are α and β in words?

Answer

α = the probability that you think the bag cannot withstand -15 degrees F, when in fact it can

β = the probability that you think the bag can withstand -15 degrees F, when in fact it cannot

? Exercise 9.3.1.8

In words, describe $1 - \beta$ For Exercise 9.3.1.

? Exercise 9.3.1.9

A group of doctors is deciding whether or not to perform an operation. Suppose the null hypothesis, H_0 , is: the surgical procedure will go well. State the Type I and Type II errors in complete sentences.

Answer

Type I: The procedure will go well, but the doctors think it will not.

Type II: The procedure will not go well, but the doctors think it will.

? Exercise 9.3.1.10

A group of doctors is deciding whether or not to perform an operation. Suppose the null hypothesis, H_0 , is: the surgical procedure will go well. Which is the error with the greater consequence?

? Exercise 9.3.1.11

The power of a test is 0.981. What is the probability of a Type II error?

Answer

0.019

? Exercise 9.3.1.12

A group of divers is exploring an old sunken ship. Suppose the null hypothesis, H_0 , is: the sunken ship does not contain buried treasure. State the Type I and Type II errors in complete sentences.

? Exercise 9.3.1.13

A microbiologist is testing a water sample for E-coli. Suppose the null hypothesis, H_0 , is: the sample does not contain E-coli. The probability that the sample does not contain E-coli, but the microbiologist thinks it does is 0.012. The probability that the sample does contain E-coli, but the microbiologist thinks it does not is 0.002. What is the power of this test?

Answer

0.998

? Exercise 9.3.1.14

A microbiologist is testing a water sample for E-coli. Suppose the null hypothesis, H_0 , is: the sample contains E-coli. Which is the error with the greater consequence?
